Future Armoured Vehicles Weapon Systems will return on the 28<sup>th</sup> and 29<sup>th</sup> June 2017 to London to discuss the very latest technological developments from research and the industry that are enhancing combat effectiveness and lethality.

Both within the conventional and asymmetrical environments, armoured vehicle lethality has always (and continues to offer), a vital means of boosting the combat effectiveness of ground forces. However, this conference is particularly timely. As the US Army increases its presence of heavy armour in Europe to the highest levels seen in years, there is a need to develop offensive assets and the deterrence capabilities that the armoured vehicle provides. In recent years hostile actors have increased their own combat vehicles protection, armament and fires to near peer status. There is therefore a need to re-examine and assess the effectiveness of NATO fighting vehicle offensive capability and means of countering threats.

Drawing on experience from previous operations and ongoing activity in the capability development space, future requirements will be presented and discussed. Importantly, to increase awareness of the technologies and capabilities that might be leveraged, an examination of the latest **weapon systems, vehicle configurations, smart munitions, high energy lasers, fire control, targeting, simulation and autonomous technology**, shall be just some of the areas covered.

**Notable presenters include** Slovenian Ministry of Defence, NSPA, British Army, Danish Army Combat and Fire Support Centre, Spanish MoD, US Army, Finnish Army, Vetronics Research Centre, Soucy Defence, UK Armed Forces, United States Marine Corps and United States Army.
